

What is claimed is:

1. A separation/attachment of a seat for vehicles having a structure that latch holes of a lower frame of the seat, which
5 has front and rear wheels, are engaged to strikers fixed in front and rear seating holes of a car body floor, the separation/attachment comprising:

a lever for relaxing the rear wheel, the lever being
connected and mounted on a rotating bracket in the front latch
10 hole through the medium of a hinge shaft and a movable pin; and
the rotating bracket connected through the medium of a support lever and a connection link, on which the rear wheel is
mounted.

15 2. The separation/attachment of a seat for vehicles according to claim 1, wherein the movable pin of the rear wheel relaxing lever is freely moved by external force in a guide hole of the rotating bracket.

20 3. The separation/attachment of a seat for vehicles according to claim 1, wherein the connection links are connected to the rotating bracket of the support lever at both ends through the medium of fixing pins.
